📸 A picture for every step

The complete **setup** guide

Follow along in order. By the end you'll have four things to paste into the onboarding form — and your bot ready to go.

THE GOAL

Collect four things

Keep a note open (or the printable checklist) and paste each item as you find it. Hand us these four, and the bot does the rest.

#	Item	Where it comes from
1	Kalshi API Key ID	Kalshi website — Section 2
2	Kalshi PEM file	Kalshi website — Section 2
3	Telegram Bot Token	BotFather — Section 6
4	Telegram Chat ID	@userinfobot — Section 9

1 Create a Kalshi account

Kalshi is the regulated exchange where your trades happen.

The Kalshi sign-up screen — enter your email and a password.

- 1 Open the **Create Your Kalshi Account** button from the start page or your welcome email.
- 2 Enter your **email** and choose a **password**.
- 3 Click **Create account**.

Already have Kalshi?

That's fine — just log in and skip to Section 2.

Verify your email

Open the email from Kalshi and click the verify link.

- 1 Find the **verification email** from Kalshi in your inbox and click the link inside it.

What you should see: a "verified" confirmation, then you're returned to Kalshi, logged in.

Identity verification (if asked)

To trade real money, Kalshi may ask you to confirm your identity (name, date of birth, last 4 of your SSN). Follow the prompts — this is Kalshi's standard process for any US exchange, not ours.

You can keep going

You can finish this whole guide even while identity check is "pending." It only needs to be approved before you fund and go live — a later step.

Log in

Your Kalshi dashboard. Next stop: Settings.

What you should see: the Kalshi dashboard with your balance (likely \$0.00 — funding comes later).

2 Generate Kalshi API credentials

The most important section. You'll collect **Thing #1 (Key ID)** and **Thing #2 (PEM file)** here.

Open API settings

Settings > API Keys > Create API Key.

1 Click **Settings** (or your profile menu), then find **API Keys**.

2 Click **Create API Key**.

💡 Can't find it?

It may live under **Settings** → **Security** → **API** or a "Developers"/"API Access" menu. Look for the word **API**. On a phone, use the Kalshi **website in a browser** — API keys are far easier there.

Name and create the key

Name it **FlipPulse** so you'll recognise it.

- 1 Give the key a name — we suggest **FlipPulse** .
- 2 Click **Create key**.

Copy the Key ID and download the PEM

Copy the Key ID (Thing #1) and download the PEM (Thing #2).

- 1 **Copy the API Key ID** — a long code like **a1b2c3d4-0000-4e5f-9a8b-1234567890ab** . Paste it into your note. (*This is Thing #1.*)
- 2 **Download the PEM file**. A file like **kalshi-flippulse.pem** saves to your **Downloads** folder. (*This is Thing #2.*)

● CRITICAL — the PEM downloads only once

Kalshi shows the private key a single time. If you leave this page without downloading, you can't get the same one back — you'd have to make a new key. **Download it now.**

Save the PEM safely

Move the file somewhere you'll find it (e.g. a `FlipPulse` folder). You'll simply **upload the file as-is** at the end. Don't rename its contents, open it in Word/Notes and re-save, or copy the text out — that can corrupt it.

What you should see: the Key ID in your note, and a `.pem` file in your Downloads folder.

If something goes wrong

Problem	Fix
Can't find API settings	Use the Kalshi website in a browser ; look under Settings → Security; search the page for "API".
PEM won't download	Try another browser (Chrome, Edge, Safari, Firefox); turn off pop-up/download blocking for kalshi.com.
Browser blocked it	Click the small "download blocked" icon in the address bar → Keep/Allow , then Download again.
Lost the PEM	It can't be re-downloaded — just create a new API key and use the new pair.
Made several keys	Make sure the Key ID matches the PEM from the <i>same</i> key. When in doubt, create one fresh key and use only that pair.

3 Install Telegram

The free app your bot uses to text you alerts.

Get Telegram

The bot sends your alerts here. Install it on any device.

1

Windows
telegram.org/dl

macOS
App Store

Linux
telegram.org/dl

iPhone
App Store

Android
Google Play

Pick your device → install

Telegram – install on Windows, macOS, Linux, iPhone or Android

Install on whichever device you'll check for alerts.

Windows
telegram.org

macOS
App Store

Linux
telegram.org

iPhone
App Store

Android
Google Play

Desktop: run the installer and click through Next → Install → Finish (Windows), or drag Telegram to Applications and open it (macOS).

Mobile: tap Get/Install in the App Store or Google Play.

Set up your account

Sign in with your phone number and the code Telegram texts you.

- 1 Open Telegram and tap **Start Messaging**.
- 2 Enter your **phone number**; Telegram texts a **5-digit code**.
- 3 Type the code, add your **first name**, and you're in.

● Get the real Telegram

The genuine app is by "**Telegram FZ-LLC**" with a **blue paper-plane** icon. If you grabbed a copycat, delete it and use the links above.

What you should see: the Telegram home screen with a **search bar** at the top.

4 Create your Telegram bot

You'll make your personal alert bot by chatting with Telegram's official bot-maker, **BotFather**.

Tap the verified BotFather

Telegram – search @BotFather and tap the verified (✓) result

Search **BotFather** and tap the one with the blue ✓.

- 1 Tap the **search bar** and type **BotFather**.
- 2 Tap **BotFather** — the result with the **blue verified check (✓)**. There are fakes; the checkmark is how you spot the real one.

Press Start, then type **/newbot** in the message box.

1

Tap **Start** (or the **START** button at the bottom).

2

In the message box at the bottom, type `/newbot` and send it.

Where do I type?

The **message box** is the long bar at the very bottom of the chat — the same place you'd type "hello" to a friend. Type `/newbot` and press the send arrow (➤).

5 Name your bot

BotFather asks two quick questions.

A friendly name, then a unique username ending in **bot**.

1

Bot name — a friendly label, e.g. `FlipPulse Alerts` . Send it.

2

Bot username — a unique @handle that **must end in `bot`** and has no spaces.

Valid usernames

- `flippulse_jane_bot`
- `janes_flippulse_bot`
- `jane2026alertsbot`

Invalid usernames

- `flippulse_jane` — no "bot"
- `FlipPulse Jane bot` — spaces
- `flippulse_bot` — taken

"Username already taken"?

Normal — just add numbers or your name until it's accepted, e.g. `flippulse_jane_8391_bot` .

6 Copy the bot token

This is **Thing #3**. Treat it like a password.

Telegram – tap the long token to copy it (keep it secret)

Tap the long token to copy it — the whole thing.

1 Tap the token once to copy it (on desktop, select the line and press `Ctrl + C` / `⌘ + C`).

2 Paste it into your note. (*This is Thing #3.*)

● Never share your bot token

Anyone with it can control your alert bot. We only ask for it inside the secure form. FlipPulse staff will **never** ask for it by email, text, or phone.

What you should see: the full token in your note — a number, a colon `:`, then a long string of letters. Make sure you copied **everything after the colon** too.

7 Open your bot

Open the bot you just made — this is **your** bot, not BotFather.

1 In BotFather's message there's a link like `t.me/flippulse_jane_bot` — **tap** it. Or search your bot's username to find it.

2 You'll land in a fresh, empty chat with your bot's name at the top.

💡 Right chat?

The name at the top should be **your bot's name** (e.g. "FlipPulse Alerts"), not "BotFather".

8 Click Start

One tap that's easy to miss — and essential.

Telegram – open your new bot and tap START (it won't work otherwise)

Tap the big START button in your bot's chat.

1

Tap **START** at the bottom of your bot's chat.

● **This step is required**

Telegram blocks bots from messaging you until **you** press Start first. Skip it and your bot simply can't send alerts — even though everything else is right.

What you should see: the START button disappears and a normal message box appears. That's the sign it worked.

9 Get your Telegram Chat ID

The last item — **Thing #4** — from another official helper, @userinfobot.

Telegram – @userinfobot replies with your numeric Chat ID

Send **hi** ; copy only the number after **Id:** .

- 1 Tap the **search bar** and type `userinfobot`.
- 2 Open `@userinfobot` and tap **Start**.
- 3 Send the message `hi` (any message works).
- 4 It replies with a line `Id: 123456789`. **Copy only the number.** (*This is Thing #4.*)

What you should see: a reply containing `Id:` and a number (usually 8–10 digits). Copy just the digits.

Numbers only

The Chat ID is only digits (sometimes a leading minus for groups). If you copied any letters, grab just the number after `Id:`.

10

Complete the onboarding form

You collected everything!

- ☒ Kalshi API Key ID
- ☒ Kalshi PEM file (in Downloads)
- ☒ Telegram Bot Token
- ☒ Telegram Chat ID

Open the onboarding form, paste in each item, and upload your PEM file. We provision your bot in **paper mode** (fake money) automatically so you can watch it work risk-free first.

[Continue to Customer Onboarding →](#)

FAQ & troubleshooting

Almost every question people ask, answered.

+ I lost my PEM file.

+ I can't find the API settings on Kalshi.

+ My bot token isn't working / the bot never messages me.

+ I don't see the Start button.

+ @BotFather isn't responding.

+ @userinfobot isn't responding.

+ I accidentally created two bots.

+ I downloaded the wrong Telegram app.

+ My Chat ID isn't appearing.

+ Is my money safe? What can the API key do?

+ Do I need to fund my Kalshi account now?

Quick troubleshooting table

Symptom	Likely cause	Do this
Can't create an API key	Using the mobile app	Open kalshi.com in a browser → Settings → API
PEM didn't download	Browser blocked it	Allow downloads for kalshi.com or switch browsers, then Download again
Lost the PEM	It downloads once	Create a new API key; use the new PEM + Key ID
Fake Telegram installed	Copypcat app	Reinstall the official app (blue plane, Telegram FZ-LLC)
BotFather silent	Fake bot / connection	Open the ✓ verified BotFather; send <code>/start</code> ; check internet
"Username already taken"	Popular name	Add numbers/your name; must end in <code>bot</code>
Bot never texts me	Didn't press START	Open your bot, tap START (or send <code>/start</code>)
Token "invalid"	Copied partially	Re-copy the whole token (BotFather → <code>/mybots</code> → API Token)
No Chat ID shown	Didn't message userinfobot	Tap Start, send <code>hi</code> , read the <code>Id:</code> number
Chat ID has letters	Copied wrong part	Copy only the digits after <code>Id:</code>

Still stuck?

Message us with (a) the Section number you're on and (b) a screenshot of what you see. We'll sort it out — but if you followed the pictures here, you almost certainly won't need to.

FlipPulse · Your keys and token are sent over a secure (HTTPS) connection, encrypted at rest, and never shared. Funds always remain in your own Kalshi account.
